Empresa líder en la fabricación de motoredutores y reductores de velocidad con más de 50 años de actividad en el país, basada como siempre en su firme convicción de producir la más alta calidad del mercado y habiendo comprobado que en el país hacía falta una renovación tecnológica en este ramo, presenta su línea de reductores y motoredutores a engranajes con Calidad Internacional.

CARACTERÍSTICAS Y VENTAJAS DE ESTA SERIE

- Diseño modular con reducida cantidad de componentes y amplia gama de relaciones disponibles.
- Todos los engranajes y piñones cementados y templados y con flancos rectificadas ó afeitados según corresponda.
- Estricto control de calidad con equipos de medición de alta precisión para el dentado de engranajes únicos en el ramo.
- Alto rendimiento y funcionamiento suave y silencioso.
- Elevada duración.
- Producción económica debido a la posibilidad de fabricar componentes en serie y para stock.
- Diseño compacto con reducido peso y volúmen. Facilita el proyecto del usuario al requerir menos espacio y costos estructurales.
- Laboratorio metalográfico propio, para control de los materiales y su tratamiento térmico.

CONSTRUCCIÓN MODULAR

Nuestra nueva línea de cajas de engranajes ha sido diseñada de acuerdo a series standard de números normalizados. Esto significa, que los tamaños de los engranajes, las relaciones de transmisión y las principales dimensiones siguen una determinada progresión que permite racionalizar la producción, minimizar stock, reducir costos y contar con plazos de entrega breves.

El diseño de esta nueva línea es la culminación de muchos años de experiencia en la fabricación de diferentes series de elementos de transmisión.

ENGRANAJES

Todos los piñones y engranajes de esta serie de reductores de simple doble o triple reducción son construídos con aceros especiales de cementación y temple, obteniéndose de esta forma un dentado con elevada dureza superficial y gran resistencia al desgaste en combinación con un núcleo dúctil de excelente tenacidad. Posteriormente se rectifican los flancos de los

Lentax is a market leader in the design and manufacture of speed reducers and gearmotors with more than 50 years of experience servicing the toughest applications.

Our quality and dedication to our customers comes from the basic principle of creating the highest quality product using the latest technological advances in design and manufacturing.

This catalogue features our newly expanded line of helical gears speed reducers and accessories.

FEATURES AND BENEFITS.

- *Modular design using less components for greater reliability.*
- *All gears and pinions are machined from the highest quality materials and then heat treated and super finished to exacting tolerances for outstanding performance.*
- *Lentax maintains strict quality control of all gear tooth profiles using specialized equipment to ensure maximum meshing of each gear set.*
- *Lentax maintains a full metallurgic lab in house that constantly monitors metal quality and hardness.*
- *High performance, smooth and silent operation with exceptional durability.*
- *Large production runs ensure customers of quick deliveries and reduced production costs that make our speed reducers competitive on the world markets.*
- *Superior design techniques result in providing a more compact speed reducer design without sacrificing performance, allowing designers and users to scale down space and structural needs.*
- *Every speed reducer undergoes a strict multi point run-in test in our factory to ensure that you, the customer, can depend on a sure start each and every time.*

HELICAL GEAR SPEED REDUCER MODULAR CONSTRUCTION

This newly updated product line was carefully rationalized in order to provide the customer with an outstanding range of standard models to choose from. Lentax also integrated a new format of production scheduling that rationalizes production to ensure quick reaction times to all of our customer needs.

GEARS

All of the gear components used in our in-line speed reducers are manufactured from the highest quality case hardened alloy steel. The gear teeth are subsequently treated to obtain a perfect helicoidal profile that ensures the correct helical angle and

dientes lográndose así un dentado helicoidal con perfil corregido de elevada capacidad portante. Paralelamente, se realiza un estricto control de la evolvente de los dientes, el paso, el ángulo de hélice y la concentricidad de cada par de engranajes.

La concepción de modularidad aplicada al diseño de estas cajas, permite utilizar los pares de engranajes en diferentes tamaños de serie.

Estos engranajes se caracterizan también por su elevado rendimiento, (98.5 % por cada etapa) funcionamiento suave y gran durabilidad.

CAJAS REDUCTORAS

Todos los cuerpos reductores de esta serie son fabricados en fundición de hierro gris ampliamente dimensionados y provistos de nervios de refuerzo que aumentan su rigidez e indeformabilidad.

Las carcasas son monocasco (línea KL), confiriéndole mayor rigidez y elevada precisión en el mecanizado en centros de mecanizado C.N.C. de última generación.

RODAMIENTOS

Los reductores de esta línea están totalmente montados sobre rodamientos de rodillos ó bolas, según corresponda, de alta capacidad de carga.

EJES

Los ejes de entrada y salida están contruidos con acero SAE 1045. Todos los asientos y puntas de ejes son rectificadas.

Ambos ejes van provistos de retenes de goma sintética que aseguran la estanqueidad del reductor y la consiguiente protección contra la entrada de polvo y salpicaduras de agua del exterior.

ACCESORIOS

Bajo pedido, los reductores pueden ser entregados con un mecanismo anti-retroceso que permite el giro del reductor en un solo sentido impidiendo su retroceso por efecto de las cargas externas.

Cuando sea necesario pueden ser provistos con trompa para agitador.

LUBRICACIÓN

El sistema de lubricación de estos reductores es por baño de aceite. La lubricación de los rodamientos es por salpicado o blindados según corresponda y queda asegurada debido al diseño especial del interior, que además permite la retención de parte del aceite en el rodamiento cuando el equipo está en reposo.

Las unidades son entregadas con su carga inicial de aceite de base mineral aditivado.

Para mayor información consulte nuestro Manual de Servicio.

concentricity of all the gear sets. This perfect matching of profiles allows for factory interchangeability of gear sets that reduces lead times while always providing speed reducers unrivaled for performance, durability and smooth quiet operation.

Lentax helical gear speed reducers exceed 98.5% efficiency per stage.

CASING

All of the casings in this series of speed reducers are designed and manufactured from close grained cast iron that includes integral ribs and reinforced sections to assure high physical strength and torsional stability to provide a long service life.

All of our speed reducers have matched covers and bases and are factory leak tested.

BEARINGS

Lentax uses only the highest quality ball and roller bearings in the production of these speed reducers.

All bearings are chosen with very generous safety margins to allow for high load capacities.

SHAFTS

All our shafts are made from high strength alloy steel, verified for trueness and diameter to exacting standards.

Highest quality oil seals render these units impervious to contamination from dust or water spray.

ACCESSORIES

These speed reducers can be ordered with an anti-reversing mechanism (backstop) that will prevent the speed reducer from turning backwards once the driving motor has stopped.

In addition, if the application requires it, these speed reducers can be ordered with a turret for agitator.

LUBRICATION

Lentax helical gear speed reducers use a highly efficient oil bath lubrication system that reaches all of the critical areas within the gear casing and due to the special design of the parts, the bearings retain some of the oil even when the unit has not been running, to prevent the possibility of dry starts after a shutdown. Lentax provide these gear boxes with a full crankcase of mineral oil.

For further information refer to our Service Manual.

SELECCIÓN DEL REDUCTOR

Debido a la diversidad de aplicaciones y condiciones de trabajo, a las cuales puede ser sometido un reductor perteneciente a una línea standard, los fabricantes dan las potencias transmisibles para determinadas condiciones de servicio (Carga uniforme, 8/10 hs. de servicio y accionamiento con motor eléctrico). Recomendamos seguir cuidadosamente los pasos que se detallan, para así poder lograr una correcta performance del equipo seleccionado y ante cualquier duda consultar a la fábrica.

PASOS A SEGUIR

- 1) Calcular la potencia absorbida (Nabs).
- 2) Calcular la potencia de entrada (Ne).
- 3) Determinar el factor de Servicio (fs).
- 4) Calcular la potencia de entrada equivalente
 $Neq = Ne \cdot fs$
- 5) Calcular la relación ($i = ne/ns$).
- 6) Preseleccionar un modelo.
- 7) Comprobar que $Nnominal > Neq$.**
- 8) Controlar la potencia de arranque
($Narr < 2,5 \cdot Nnominal$)
- 9) Controlar las cargas radiales.

POTENCIA ABSORBIDA

Es la potencia teórica necesaria para el accionamiento. Dicho valor calculado y suministrado por el cliente, no debe incluir adicionales por condiciones de servicio.

POTENCIA DE ENTRADA

Esta potencia debe ser referida al eje de entrada afectando la Potencia Absorbida por el rendimiento del reductor. (98.5% por cada etapa).

FACTOR DE SERVICIO

En las tablas adjuntas, (ver pgs. 11 a 14) se detallan los factores de servicio correspondientes a la máquina accionada, tipo de motor de accionamiento y cantidad de arranques por hora.

POTENCIA DE ARRANQUE

Los reductores de esta serie, están calculados para resistir potencias de arranque y sobrecargas instantáneas de hasta 2,5 veces la potencia nominal. Cuando este valor sea superado, será necesario consultar a nuestro departamento técnico.

SELECCIÓN DEL MOTOREDUCTOR

La potencia del motor (Nm) multiplicada por el factor de seguridad del equipo (fz) debe ser igual o mayor que la potencia equivalente. ($Nabs.Fs/rend$).

SPEED REDUCER SELECTION

Due to the diversity of applications and working conditions that a speed reducer can be subjected to, manufacturers of speed reducers generally state the transmissible capacity for specific conditions of service. As an example, 8-10 hours a day, uniform load, and coupled to an electric motor. When choosing your speed reducer requirements, take into consideration the actual service conditions and compare them to the figures shown on the tables.

HOW TO SELECT

- 1) Calculate the necessary Power (Nabs).
- 2) Calculate the Input Power (Ne).
- 3) Calculate the service factor (fs).
- 4) Calculate the equivalent Input Power.
 $(Neq=fs \cdot Ne)$.
- 5) Calculate the ratio. ($i = ne/ns$).
- 6) Preselect a model.
- 7) Verify that ($Nnominal > Neq$).**
- 8) Determine the required starting capacity. (**$Nstr < 2.5 \cdot Nnom$**).
- 9) Determine the radial load

NECESSARY POWER

This is the theoretical power required for proper operation not taking into account any additional service conditions, this should be calculated in relation to the input shaft.

INPUT POWER

This is the necessary power increased by the reducer efficiency.
 $Ne = Nabs / efficiency$

SERVICE FACTOR

Refer to the following tables and select the type of example that is comparable to your specific application. (If unsure, contact your closest Lentax representative for assistance).

STARTING CAPACITY

Lentax helical gear speed reducers have been designed to withstand up to 2.5 times normal load capacities on startup. Should your start up loads be greater, please check with the factory.

GEARMOTOR SELECTION

Must verify that: $Nmotor \cdot fz > Neq$
 $Nmotor =$ Motor power
 $fz =$ Safety factor of gearmotor.

ENTREGA MANIPULEO MONTAJE

Todos los reductores se someten en fábrica a un período de marcha en vacío en el cual se verifica su correcto funcionamiento, estanqueidad y los datos de fabricación solicitados por el cliente.

Normalmente las unidades se entregan sin embalaje salvo que se lo solicite expresamente. El costo del mismo no está incluido en el precio de venta.

El equipo se debe levantar mediante lingas que lo rodeen totalmente, pasando por su base o mediante el cáncamo dispuesto para tal fin.

Para colocar acoplamientos, piñones de cadena o engranajes se debe utilizar el centro roscado de los ejes evitando hacerlo mediante golpes, aún cuando se haga sobre un taco de madera interpuesto.

Los ejes se entregan rectificadas con tolerancia ISO k6, recomendándose para las piezas a acoplar ISO H7, estas deberán ser fijadas axialmente mediante prisioneros. Los chaveteros se fabrican según DIN 6885 hoja 1.

El reductor deberá montarse sobre bases planas, niveladas y rígidas, esto es importante para asegurar la correcta lubricación y evitar tensiones adicionales sobre el cuerpo del mismo.

Es necesario verificar la correcta alineación de los ejes de entrada y salida con el motor de mando y con la máquina accionada (especialmente cuando se monta un par de engranajes o existe un apoyo externo).

Para una perfecta nivelación de la base, recomendamos usar suplementos de chapa, y solamente luego de verificada apretar firmemente los bulones de la base.

En los reductores que operan a la intemperie, es aconsejable proveer una cobertura protectora. Lo mismo es válido, cuando el ambiente es muy sucio o se está en presencia de salpicaduras de agua, radiación de calor, polvo, etc.

Cuando en el eje de salida se instale un mando a cadena o un par de engranajes, se deberá verificar que la dirección de la fuerza resultante esté dirigida preferentemente hacia la base, en caso contrario rogamos consultarnos. En los reductores con antiretroceso incorporado, se verificará previamente que el sentido de giro del motor eléctrico sea el que corresponde al marcado en el reductor.

PUESTA EN MARCHA

Se recomienda rodar el reductor en vacío durante un período de 2 / 3 hs., para luego proceder a aplicar la carga en forma gradual hasta la plena potencia. En ambas fases, controlar que el funcionamiento sea normal con ausencia de vibraciones, ruidos y temperaturas anormales. La temperatura del aceite puede llegar a 100°C en condiciones de temperatura del ambiente normal. Asimismo pueden aceptarse períodos breves con temperaturas de alrededor de 120°C. Se aconseja rodar con intervalos de 3/4 semanas, aquellos reductores que por razones de servicio, deban permanecer parados por largos períodos de tiempo (3 o más meses).

DELIVERY, HANDLING, INSTALLATION AND FIELD ASSEMBLY.

All speed reducers are factory inspected prior to shipping and compared to the customer purchase order for verification of proper match. They are tested during a run-in period for smooth operation, output speed, noise and temperature.

Normally, this model of speed reducer is delivered in standard cardboard packaging .

These speed reducers must be properly supported when removed from their packaging and during installation. Care must be taken when installing couplings or sprockets onto the shafts avoiding blows that can displace internal components from their correct relationships to each other.

The keyways exceed DIN 6885 section 1.

The shafts are prepared to a tolerance of iso k6 with our recommendation to use coupling parts that are to iso H7, and these should be axially locked with bolts.

The speed reducers must be securely installed on a solid and level base to ensure proper lubrication and not to subject the casing and components to any undue lateral or torsional stress.

Alignment of the input and output shafts to the driving motor and driven machine are critical for the performance and service life of the speed reducer.

The use of steel shims or plates is recommended to level the unit out and once this is done, to securely fasten down the speed reducer with appropriately sized bolts.

If the speed reducer is to operate outdoors or in a very dusty area, exposed to water spray or a radiating heat source, we recommend that some protection be put around the speed reducer. If you are unsure of your application conditions, please check with the factory.

Always install the output connections such that the output force is directed towards the base of the speed reducer.

In speed reducers that incorporate anti-reverse features (Backstop) ensure that the motor turns in the same direction as indicated on the speed reducer.

INITIAL START-UP

It is recommended to run-in the speed reducer without load for 2 or 3 hours during which time the unit should be checked for vibration and leaks. After this brief interval, the load should be gradually applied until the full load is on the speed reducer and the operation of the unit is confirmed to be smooth and quiet and that the operating temperature of the unit does not exceed recommended levels.

The operating temperature of the oil can reach 100 deg. C. in normal operating ambient and considered normal as well as brief operation up to 120 deg. C.

If the speed reducer needs to be out of operation for more than 3 months, Lentax recommends a brief period of operation every 3-4 weeks, with or without load, to keep a film of protective lubricant on the internal parts.

CAMBIO DE ACEITE

El primer cambio de aceite se deberá efectuar a las 20000 hs. de marcha en el caso de aceite sintético y a las 5000 hs en el caso de aceite con base mineral.

El drenaje del aceite se efectuará inmediatamente, evitando que se enfríe.

Recomendamos reponer o agregar lubricantes del mismo tipo y marca. Cuando se lo desee cambiar, se deberá realizar previamente un correcto lavado del reductor, evitando así la mezcla de diferentes clases.

El lubricante se carga a través de la tapa de inspección.

Vigilar que el nivel se encuentre dentro de los límites establecidos. Si es bajo, la lubricación será insuficiente. Si es alto se produce un calentamiento adicional por el batido, con pérdida de rendimiento y peligro de formación de espuma.

Verificar periódicamente el nivel de aceite, con el reductor parado y frío. Agregar si el nivel se encuentra por debajo de la marca inferior.

Los rodamientos no requieren lubricación adicional dado que la reciben por salpicado al escurrir el aceite hacia el cárter del reductor.

GARANTÍA

Todos los reductores gozan de una garantía de 1 año contra todo defecto de material y/o fabricación, calculada a partir de su fecha de entrega.

Durante ese período, se repondrá o se reparará sin cargo cualquier pieza que según nuestro examen resulte con defectos de fabricación.

Para formalizar cualquier reclamo de garantía, el usuario deberá remitirnos sin desarmar el equipo a nuestra fábrica, con indicación de las condiciones de servicio y de la falla detectada.

No estarán incluidos dentro de la garantía los siguientes casos:

- 1) Falta de lubricante, o de tipo y/o calidad inapropiado.
- 2) Condiciones de servicio diferentes a las especificadas en el pedido.
- 3) Montaje inadecuado.
- 4) Cualquier otra aplicación no contemplada en el presente catálogo o expresamente autorizada por nuestro departamento técnico.

CORROSIÓN

Los reductores de velocidad Lentax no están garantizados contra daños producidos por corrosión .

RESPONSABILIDAD

Los datos técnicos contenidos en este catálogo están sujetos a modificaciones dimensionales o de diseño sin previo aviso. Quedando a criterio de Lentax la provisión o nó de los equipos de acuerdo a las presentes especificaciones.

OIL CHANGE

Lentax recommends the oil change every 20,000 hours of operation for units with synthetic oil and every 5,000 hours for units with mineral oil.

It is strongly recommended that you verify your choice of lubricating oil with Lentax if deviating from the recommended type.

We recommend to always top up the oil reservoir using the same type and grade of oil. If switching between standard and synthetic oils, it may be advisable to wash the oil chamber clean prior to adding the new type of oil.

WARRANTY

Lentax warrants to the purchaser of each new product that any part thereof which proves to be defective in material or workmanship under normal use within 18 months of the date of shipment, or 12 months from the date of start operation, (whichever occurs first) will be repaired or replaced without charge. Any such defect must be brought to the attention of the company's office from which the product was purchased, which is authorized to furnish repair or replacement within the terms of this warranty. The company will not be responsible for any expenses incurred in the installation, removal from service, transportation cost, or for damages of any type whatsoever, including incidental or consequential damages. Some states and provinces do not allow exclusion or limitation of incidental or consequential damages so the preceding exclusion or limitation may not apply to you.

Since Lentax cannot anticipate or control the conditions under which our products may be used, we accept no responsibility for the safety and suitability of our products when used alone or in combination with other products, tests for safety and suitability of the products should be done by the user.

This warranty will not apply, if in the judgement of the company, damage or failure has resulted from accident, alteration, misuse, abuse or operation in any way different than specified initially. The foregoing is in lieu of other warranties expressed or implied. Lentax neither assumes nor authorizes any person to assume for it any other obligation or liability in connection with said product.

Since the paint finish may be damaged in use, no warranty applies to such paint finish except for manufacturing defects which become apparent in the first 30 days of operation.

CORROSION

Speed reducers are not guaranteed against damage caused by corrosion.

LIABILITY

Technical data contained in this catalog is subject to change without notice. The company will endeavor to supply the equipment as illustrated, but reserves the right to make dimensional and other design changes as required.

SELECCION DEL MOTOREDUCTOR

La selección se efectúa mediante el Listado de Potencias, velocidades y momentos útiles (pgs. 18...29) debiendo verificarse que el Factor de seguridad del equipo sea mayor ó igual que el Factor de Servicio requerido.

$$F_z > F_s$$

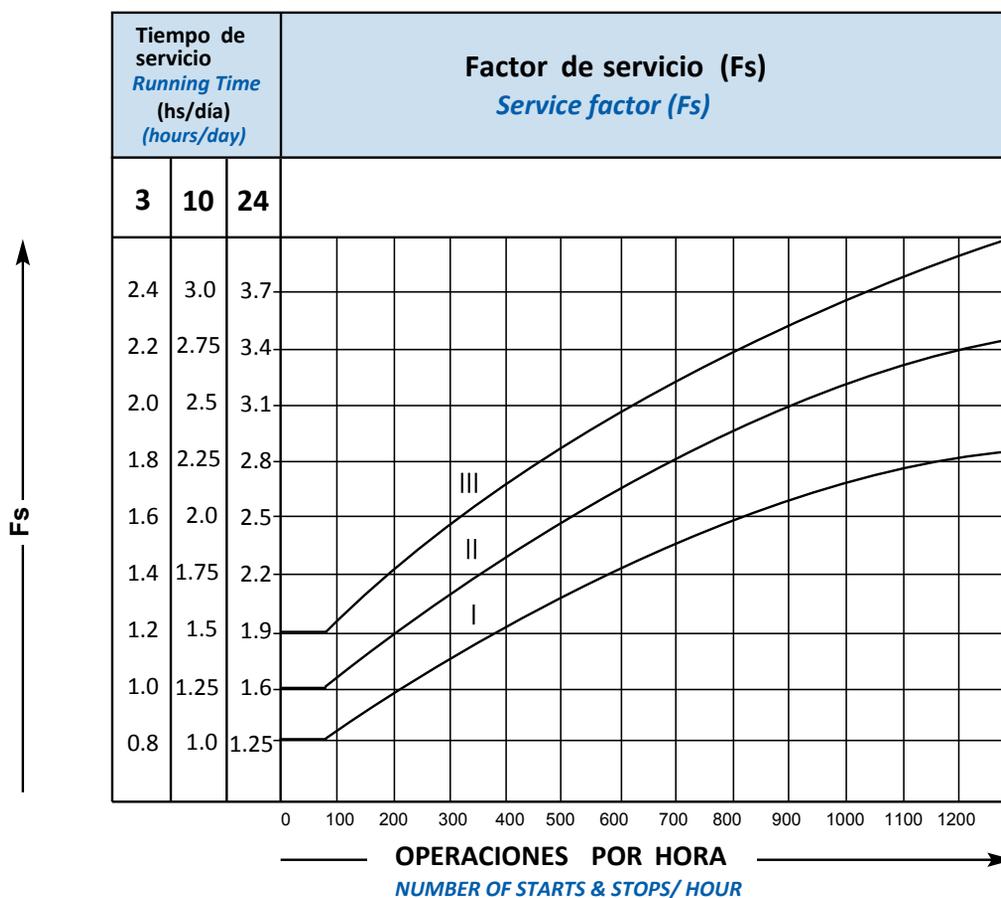

El Factor de servicio (F_s) depende del tiempo de servicio y las características de la carga, pudiendo determinarse del siguiente gráfico:

GEARMOTOR SELECTION

To select the appropriate gear unit consult the Selection Tables (pages 18...29) and must verify that the Safety Factor is equal or greater than the Service Factor.

$$F_z > F_s$$

Service Factor (F_s) depends on the running time and the load classification. It can be determined from the diagram below:

CARACTERISTICAS DE LA CARGA

LOAD CLASSIFICATION

- I REGULAR: Pequeñas masas para acelerar sin sobrecargas.
I UNIFORM LOAD: Small mass to accelerate, without overloads.
- II IRREGULAR: Medianas masas para acelerar sobrecargas medianas.
II MODERATE SHOCK LOAD: Medium mass to accelerate, moderate overloads.
- III IRREGULAR: Grandes masas para acelerar fuertes sobrecargas.
III HEAVY SHOCK LOAD: Large mass to accelerate, heavy overloads.

En las pags. 11, 12, 13 y 14 se ofrecen ejemplos típicos de aplicaciones y sus respectivos factores de servicio orientativos.

Please refer to pages 11, 12, 13 and 14 in order to help you to determinate the Service Factor.

CARGAS RADIALES

Normalmente se recomienda acoplar los reductores de potencias medias y grandes, directamente con manchones elásticos. Cuando ello no sea posible, solicitamos consultarnos, indicándonos el valor, punto de aplicación y orientación de dichas cargas.

CALCULO DE LA CARGA RADIAL

La carga radial provocada por un elemento de transmisión puede calcularse con:

$$Pr = \frac{M \cdot k \cdot k1 \cdot f}{10 Dp/2} \quad [d \text{ a N}]$$

M= Momento torsor necesario en el eje de salida (Nm)

Dp= Diametro primitivo del elemento de reduccion aplicado en el eje de salida (m).

k= Constante según el tipo de reducción.

- k= 1.0 engranajes
- k= 1.4 piñón y cadena
- k= 1.8 correas en V
- k= 2.2 correas planas

k1= Constante según el tipo de construcción.

- k1= 1.0 en equipo standard
- k1= 0.7 en equipo con trompa para agitador.
(RU, AG sobre pedido, consultarnos)

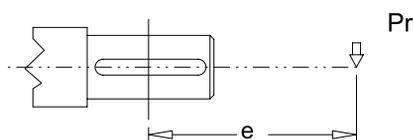

f = factor de corrección para el caso de carga aplicada fuera del centro del extremo de eje standard.

Siendo $f = 1 + \frac{e}{L}$

Donde:

e = distancia del punto de aplicación al centro del eje (m).

L= ver tabla (pag.16)

En todo caso debera verificarse que :

$$Pr < P \text{ adm}$$

Caso contrario, deberá incrementarse el diámetro del elemento de transmisión o adoptarse una caja reductora de mayor capacidad.

En casos de servicios severos rogamos consultarnos.

RADIAL LOADS

We normally recommend that medium to high H.P. speed reducers be connected to the driven machine by means of flexible coupling.

When the use of couplings is not possible, please consult the factory providing us with details of the application and the orientation that the shafts will have to each other.

CALCULATION OF RADIAL LOADS

The radial load can be calculated using the following formula:

$$Pr = \frac{M \cdot k \cdot k1 \cdot f}{Dp/2} \quad [lb]$$

M= Output torque (lb-inch).

Dp= Pitch diameter of driven pulley, gear, pinion. (inch)

k= Load connection factor.

- k= 1.0 gear
- k= 1.4 sprocket-wheel chain.
- k= 1.8 V-belt
- k= 2.2 Flat belt

k1= building factor

- k1= 1.0 in standard unit
- k1= 0.7 in agitator unit
(RU, AG under request, please consult us)

f = load location factor

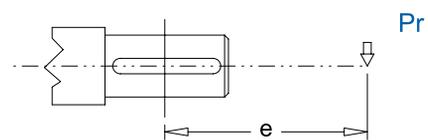

To determinate the load location factor apply the following formula.

$$f = 1 + \frac{e}{L}$$

Where:

e = distance from center line of load to midpoint of output shaft.

L = see table on page 16

Each case must verify that :

$$Pr < P \text{ adm}$$

Otherwise, the pitch diameter of driven pulley should be increased, or choose the next size up speed reducer. Anyway, on heavy duty service, check with our technical support.

CARGAS RADIALES Y AXIALES ADMISIBLES EN EL EJE DE SALIDA*

OUTPUT SHAFT OVERHUNG LOAD RATING*

Nota 1*: Validas para cargas aplicadas en el centro de la punta de eje.

Note 1: For loads applied on the middle of the end shaft.*

Nota 2: Validas para reductor sometido a Potencia Nominal , otros casos consultarnos.

Note 2: For gearbox working at full Nominal Power, otherwise check with the factory.

Nota 3: Para solicitudes mayores consulte nuestro Depto Técnico.

Note 3: Please consult LENTAX regarding larger overhung load requeriments.

CODIGO DE DESIGNACIÓN / UNIT DESIGNATIONS

Cada unidad se subdivide en 5 campos con sus correspondientes siglas o números. Juntando éstos se obtiene el código de designación del equipo.

Every unit contains 5 fields composed by characters or numbers. Joining these items we obtain the unit designation code.

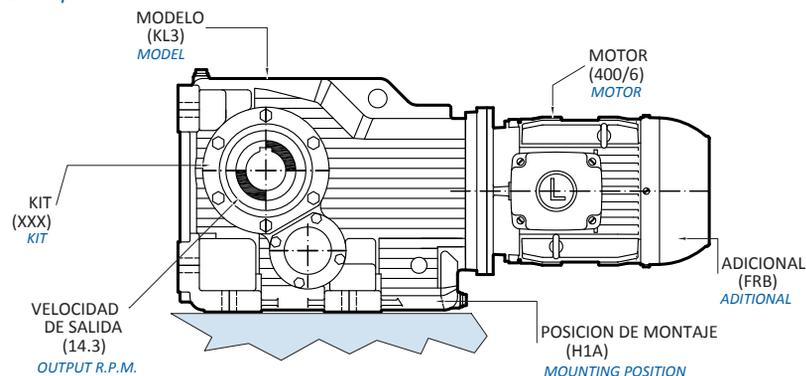

Ejemplo: **KL3 - 400/6 FRB - 14.3 - H1A - XXX**

In example

NOTA 1 : Las dimensiones son aproximadas pudiendo modificarse sin aviso previo.
 NOTE 1 : Dimensions are for reference only, unless certified.
 NOTA 2 : Las capacidades de lubricante son para posición 1A.
 NOTE 2 : Oil capacity valid only for mounting position 1A.

NOTA 3 : Para dimensiones ko, P y g1 ver pag. 35 ó catálogo de motores (I.E.C.).
 NOTE 3 : To determinate ko, P and g1 see page 35, or electrical motors catalogue (I.E.C.).
 NOTA 4 : Los pesos no incluyen peso del motor.
 NOTE 4 : Motor weight is not included.

POSICIONES DE MONTAJE

MOUNTING POSITIONS

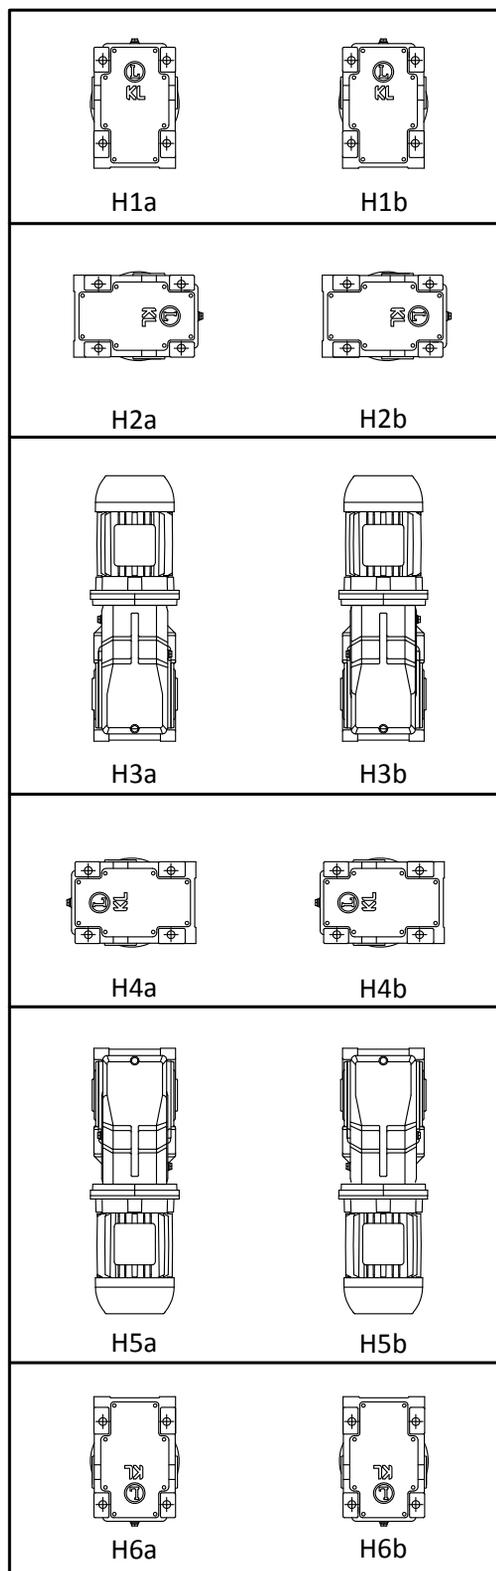

Montaje con Eje Sólido

With solid shaft

Montaje con Eje Hueco

With hollow shaft

NOTA 1 : Para montaje con brida de salida anteponer la letra "B" por ejemplo B1a , BH1a.

NOTA 1 : Para montaje con brida de salida anteponer la letra "B" por ejemplo B1a , BH1a.

NOTA 2 : Para montaje con eje de salida doble utilizar las letras "ab" por ejemplo 1ab.

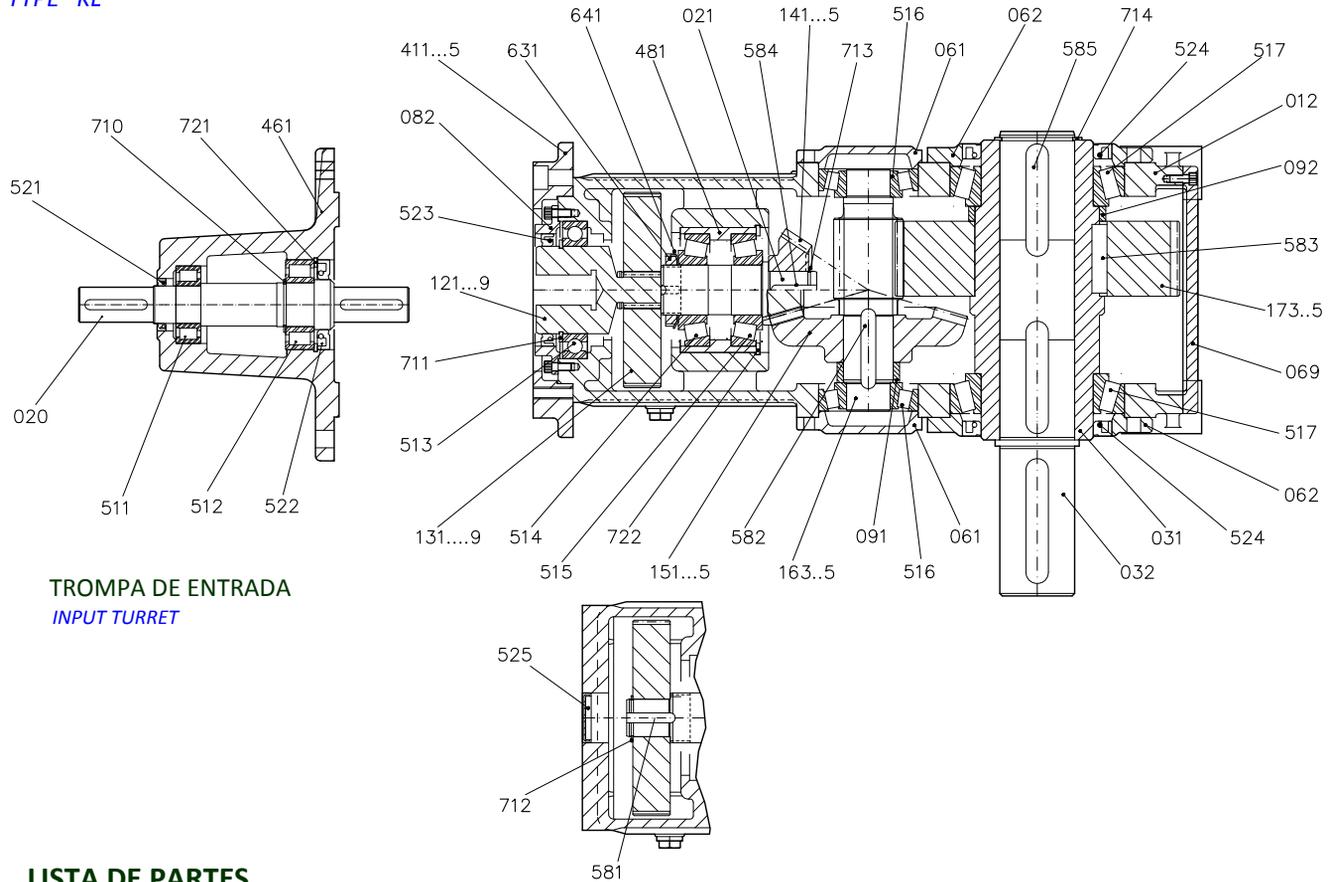

NOTA 2 : Para montaje con eje de salida doble utilizar las letras "ab" por ejemplo 1ab.
